

GOPAKUMAR

BACKEND DEVELOPER | NODE.JS & JAVA/SPRING BOOT | MICROSERVICES

8848074537 | Gopakumarg893@gmail.com | Cherthala, Alappuzha, Kerala | github.com/Gopakuma | linkedin.com/in/gopakumar-g-838b1b216

SUMMARY

Backend Developer with 2.5+ years of professional experience building production REST APIs, distributed services, and internal platforms in Node.js/TypeScript — including MOM-BENCHMARK, a live hospital benchmarking platform used across Europe — plus 1.5+ years of self-directed, project-driven Java/Spring Boot development. Actively broadening backend engineering depth into enterprise Java patterns — API gateways, service discovery, JWT-based authentication, and role-based authorization — through production-style personal projects. Comfortable across the full backend stack (REST APIs, relational and in-memory databases, Docker, event-driven patterns) with a consistent focus on clean architecture and separation of concerns.

CORE TECHNICAL SKILLS

- **Languages & Frameworks:** Node.js, Express.js, TypeScript, JavaScript, Java 21, Spring Boot, Spring Security, Spring Cloud Gateway, Spring Cloud Netflix Eureka, Spring Data JPA (Hibernate)
- **Microservices & Auth:** Microservices Architecture, JWT Authentication, Access/Refresh Token Rotation, Role-Based Access Control, API Gateway Design
- **DevOps & Cloud:** Docker & Docker Compose, Git, AWS (EC2, S3), Multi-server Deployment
- **Databases:** PostgreSQL, MSSQL, Redis
- **API & Docs:** REST APIs, OpenAPI/Swagger, RESTful API conventions

PROFESSIONAL EXPERIENCE

Software Engineer — Simplogics Solutions

2022 – 2024

- Architected and optimized MOM-BENCHMARK's distributed 4-server backend, serving 50,000+ requests/day while reducing deployment failures by 40% and ensuring high availability and seamless load distribution.
- Built scalable REST APIs and internal service-to-service communication patterns for MOM-BENCHMARK using Node.js and TypeScript, with a layered, separation-of-concerns approach.
- Engineered a shared internal package that standardized API integration patterns across MOM-BENCHMARK and other internal services, accelerating development across projects.
- Designed and refactored MSSQL schemas and complex external queries for MOM-BENCHMARK, significantly reducing query latency.
- Led a zero-downtime migration of 6 production services, including MOM-BENCHMARK, to Node.js v20 — removing deprecated dependencies and implementing advanced full-text search.
- Designed distributed backend workflows using Redis-based event signaling for asynchronous service coordination.
- Designed the relational database schema from scratch and built a Spring Boot backend (Medical Camp Registration System) for registering and managing patient records at medical camps, implementing full CRUD REST APIs for patient registration, record updates, lookups, and deletion, following RESTful API conventions.
- Built a high-throughput web scraping engine in Spring Boot (Automated News Aggregator & Keyword Analytics Tool) to concurrently extract real-time headlines from 5 major Malayalam news channels, with Redis-based event signaling between servers so a secondary service auto-initialized its API once scraping and database population completed, and an analytics API supporting date-range queries to calculate and track keyword frequency and trends over custom timeframes.

BACKEND ENGINEERING DEPTH: JAVA / SPRING BOOT (SELF-DIRECTED, 2024 – PRESENT)

To deepen enterprise Java backend patterns beyond professional Node.js work, built production-style personal projects covering API gateways, service discovery, and secure, stateless authentication — applying the same architectural principles used professionally.

E-Commerce Microservices Platform (Personal Project) | Java 21, Spring Boot, Spring Security, Spring Cloud Gateway, Eureka, PostgreSQL, Docker, JWT

- Designed a microservices architecture with API Gateway, Eureka Server, Auth Service, User Service, and Product Service, each with an isolated database and independent deployability.
- Built a centralized Auth Service issuing JWT access and refresh tokens (with refresh-token rotation and single active refresh token per user), embedding claims such as username, UUID, email, and role.
- Implemented stateless, gateway-centric authentication: the API Gateway validates tokens and injects trusted identity headers so downstream services never trust client-supplied identity.
- Enforced role-based authorization (ADMIN / CUSTOMER) using Spring Security method security (@PreAuthorize), with each service constructing its own SecurityContext from Gateway headers.
- Delivered Auth, User, and Product services with registration, login, token refresh, profile management, admin user management, and admin-only product CRUD.
- Applied production security practices throughout: BCrypt password hashing, disabled-account login prevention, stateless authentication, and consistent RESTful API design.
- Containerized the full stack with Docker & Docker Compose; documented an active roadmap covering Order/Cart/Payment services, Redis caching, Kafka/RabbitMQ, Resilience4j circuit breakers, Spring Cloud Config, CI/CD, and Kubernetes.

OTHER PROJECTS

Stretford End — Manchester United Fan Portal | Node.js, React.js, TypeScript, MSSQL

- Built a full-stack fan platform with real-time chat, structured squad insights, and high-frequency content delivery; designed secure authentication/authorization and database synchronization patterns.

Developer Portfolio | Next.js, Tailwind CSS

- Designed and deployed a responsive, SEO-optimized personal portfolio using Next.js server-side rendering.

EDUCATION

Master of Business Administration in IT — Suresh Gyan Vihar University

2021 – 2023

Bachelor of Computer Science — University of Kerala

2018 – 2021

LANGUAGES

English • Malayalam • Tamil
